About KCF

Kensium Commerce Framework (KCF) is a common framework for connecting commerce/ retail systems in Acumatica.

KCF abstracts the inner workings of Acumatica by exposing the key elements needed for commerce and provides a layer that supports real-time bi-directional syncing between Acumatica ERP and the desired platform.

The layer also abstracts 3rd party systems from the constant build/version upgrades of Acumatica as the onus lies with the Kensium to keep KCF up to date.

Kensium Commerce Framework includes:

- Supports various plugins, making KCF the single location for base configuration and initialization of the connection.
- Push notifications in the form of API Callbacks to the supported platform.
- Define exactly the fields that you are interested in (not dependent on the modified timestamp)- Reduce the number of transactions as well as the number of API requests.
- Real-time communications for both Acumatica and commerce systems.
- Ability to learn large-scale updates via batch update functionality.
- Native support for Kensium Commerce Pro Solution.
- Abstract Acumatica’s technical complexity as well as upgrade needs.
- Comprehensive Dev Logs to track all activity.
- Extensible framework that allows for commerce system-specific functionality.
