Product Overview

Customizable Kit is a group product using the Acumatica native KIT specification feature to manage the product mapping with the child components.

This feature allows you to create customizable Kits with non-stock Kits. The customizable kit will enhance the existing Non-Stock KIT functionality and will allow you to modify the components on order creation. You can add the components to the orders replacing the KIT items.

Customizable KIT allows you to define the quantity on the fly for the components. The reports will be customized to show the KIT Item with the components based on the configuration.
