Kensium Commerce Framework

Kensium Commerce Framework

The Kensium Commerce Framework (KCF) is an auxiliary connector for Acumatica ERP users that requires API connections to various commerce platforms. KCF leverages common configurations found within existing commerce connectors and allows for developers to create additional plugins and configurations to leverage real-time bidirectional syncing between Acumatica ERP and the desired platform. Multiple connections can be established and run out of KCF, making it a powerful tool for Acumatica users looking to establish multiple connections without significant impact to their ERP instance.

The Kensium Commerce Framework includes:

- Support of multiple commerce plug-ins, making KCF the single location for base configuration and initialization of the connection.
- Support of API connection to a commerce platform This configuration guide will cover the following topics:
    - Installing the Connector Package
    - Establishing a Connection within Acumatica
    - End User Scenarios
