

# Acumatica

**Menu:** Manage RMS / Acumatica

**Feature:** Acumatica Common

**Editions:** Cloud, Corporate

Use this page to control the integration with your Acumatica ERP system. All fields must be entered to provide access to your Acumatica account. These fields include:

- **Service URL** is the URL to the Acumatica server.
- **Company** is the name of the Acumatica company on the server.
- **User Name** is the user name of the account used to connect to the server.
- **Password** is the password of the account used to connect to the server. This value is securely stored within RMS.

You can use the [Diagnostics](#) page to test your Acumatica connection. Diagnostics will:

- attempt to connect to your Acumatica server
- check your Acumatica server version to ensure that it is compatible
- check that compatible Kensium customization package versions are installed
- display server and version details

Acumatica integration requires installation of the Kensium customization package into Acumatica.

In addition, you must enable the Acumatica feature version in RMS that best matches your Acumatica version. For example, if you are connecting to Acumatica 20R2, you would enable the Acumatica 20R2 feature in RMS.
