Item Check

This feature allows the user to check the qty of each bin of the selected item in our warehouse, by default, after the item check feature is opened, the warehouse and warehouse description field will be filled by the default warehouse of the user of WMS. The user will be able to scan/enter items which should belong to the warehouse shown. After the user enters the item and presses the show item bins button, a new window will be opened showing the information of the warehouse, item description and a table with all the bins and qty stored in the warehouse for the selected item.
